```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention provides a nucleic acid encoding a signal transduction protein involved in the process of dehiscence. The nucleic acids and proteins are useful for regulating or controlling dehiscence of a pod or an anther in a plant, useful in the production of male sterile plants. The methods, etc. may be used in production of shatter resistance or shatter-delayed plants such as oilseed rape (Brassica napus). The present sequence represents a DZ2 A. thaliana homologue DZ2AT3 putative peptide sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention provides a nucleic acid encoding a signal transduction protein involved in the process of dehiscence. The nucleic acids and proteins are useful for requiring or controlling dehiscence of a pod or an anther in a plant, useful in the production of male sterile plants. The methods, etc. may be used in production of shatter resistance or shatter-dehayed plants such as oilseed rape (Brassica napus). The present sequence represents the B. napus D22B putative peptide sequence.
                                                                                                                                                                                                                                                                                                          55 HRDGGSSFDLILMDKEMPERDGVSTTKKLREMEVKSMIVGVTSLADNEEERRAFWEAGLN 114

and protein sequences isolated from eucalyptus (Eucalyptus grandis) or pine (Phinus radiate also known as Monterey pine). The protein sequences pine to pine (Phinus radiate also known sequences) or pine (Phinus radiate also known sequences) are involved in cell signalling. The polynucleotide and protein sequences are involved in cell signalling. The polynucleotide and protein sequences can be used to modify the response of plant cells to external signals e.g. environmental changes or pathogens during the growth and suppose to modify cell proliferation, differentiation, elongation and survival, resistance to disease and contrinent metabolism. Examples of modifications which can be produced are altered fruit ripening and senescence of leaves and flowers e.g. to delay senescence of reproductive organs to engineer sterile plants. Other modifications can be used to delay senescence in selected cell types or organs providing fruit and vegetables which have a longer shelf life contents true species giving long stretches of valuable knot-free clear cover and veneers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       18 VLIVDDDPLNLIIHEKIIKAIGGISQTANNGEEAVIIHRDGGSSFDLILMDKEMPERDGV 77

```
The invention provides a nucleic acid encoding a signal transduction protein involved in the process of dehiscence. The nucleic acids and proteins are useful for regulating or controlling dehiscence of a pod or an anther in a plant, useful in the production of male sterile plants. The methods, etc. may be used in production of shatter resistance or shatter-delayed plants such as oilseed rape (Brassica napus). The present sequence represents the partial fragment of B. napus DZ2B protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 RscC; antagonist; agonist; cytokinin receptor; receptor; signal transduction; histidine kinase; hormone; cell division; cell differentiation; agriculture; growth regulator; harvest.

The invention discloses a method for analysing antagonist or agonist

activity to a cytckinin receptor. The method comprises bringing a
candidate substance into contact with a transformed cell, in which a DNA
candidate substance into contact with a transformed cell, in which a DNA
conciding the receptor has been intraduced, and then measuring the
existence, or the quantity, of the intracellular signal transduction from
the receptor expressed in the cell. The cytchinin receptor comprises an
extracellular region of the receptor, transmembrane regions, a histidine
kinase region and a receiver region of the kinase. The transmembrane
cell division and differentiation of higher plants. The method is used
to cell division and differentiation of higher plants. The method is used
for analysing agonist or antagonist activity to the receptor. A
substance with agonist or antagonist activity to the receptor can be
used, in agriculture, as a plant growth regulator, e.g. after harvest.
The advantage is that the candidate substances do not need to be prepared
in such large amounts as in previous methods and that the method avoids
the immensely long time to observe and evaluate the growth of the plant
and the physicological changes of the plant after spraying. The sequence
presented is the B. coll receiver region of histidine kinase which can
transmit signals to the cytokinin receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             18 VLIVDDDPLNLIHEKIIKAIGGISQTANNGEEAVIIHRDGGSSFDLILMDKEMPERDGV 77

                                                                                                                                                                                                                                                                                                                            The invention relates to a novel isolated polypeptide comprising a PvrR (variant Pseudomonas) amino acid sequence having at least 50 % identity to a 399 residue amino acid sequence, given in the specification, where expression of the polypeptide, in a microorganism, affects phenotypemediated antibiotic resistance in the microorganism. The methods and compositions of the present invention are useful for the diagnosis, prevention and treatment of gram negative or gram-positive bacterial infection. This sequence repersents a Pseudomonas protein used in the exemplification of the invention.
                                                                                                                                                                                                                       New isolated PvrR polypeptide and polynucleotide that regulates bacterial biofilm formation, useful for the diagnosis, prevention and treatment of gram-negative or gram-positive bacterial infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

Specificity of the BugAs and EvgAs phosphorelay is mediated by the "Specificity of the BugAs and EvgAs phosphorelay is mediated by the C-terminal HPt domains of the sensor proteins.";

Mol. Microbiol. 27:875-887(1998).

-!- FUNCTION: Member of the two-component regulatory system evgS/evgA. Phosphorylates evgA via a four-step phosphorelay in response to environmental signals.

-!- SUBCELLULAR LOCATION: Integral membrane protein. Inner membrane

I. DNA Res. 3:379-322(1996).

I. DNA Res. 3:379-322(1996).

I. Involved in the regulation of the expression of genes involved in colanic acid capsule synthesis. ResC probably functions as a membrane-associated protein kinase that phosphorylates rcsB in response to environmental signals.

C. -: Subschildar Location: Integral membrane protein. Inner membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Probable).

--- PTM: Activation probably requires a transfer of a phosphate group between a His in the transmitter domain and an Asp of the receiver domain (By similarity).
--- SIMILARITY: Contains 1 histidine kinase domain.
--- SIMILARITY: Contains 1 PAS (PER-ARMT-SIM) dimerization domain.
--- SIMILARITY: Contains 1 PAS (PER-ARMT-SIM) dimerization domain.
--- SIMILARITY: Contains 1 response regulatory domain.
--- CAUTION: REF. 4 SEQUENCE DIFFERS FROM THAT SHOWN DUE TO A FRAMESHIFT IN POSITION 808.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  STRAIN=K12 / MG1655.

Bacteriol, 172:6681-668(1990).

-i- FUNCTION: FRZE IS INVOLVED IN A SENSORY TRANSDUCTION PATHWAY THAT CONTROLS THE FREQUENCY AT WHICH CELLS REVERSE THEIR GLIDING DIRECTION: FRZE SEEMS TO BE CAPABLE OF AUTOPHOSPHORYLATING ITSELF ON AN HISTIDINE RESIDUE AND TERN TO TRANSFER THAT GROUP TO AN ASPARTATE RESIDUE IN THE C-TERMINAL PART OF THE PROTEIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESPONSE REGULATORY.

Kuhara S., Shiba T., Hattori M., Shinagawa H.; Scherichia coli Complete genome sequence of enterohemorrhagic Escherichia coli O157:H7 and genomic comparison with a laboratory strain K-12.";

DNA Res. 811-22(2001).

C. I- FUNCTION: Member of the two-component regulatory system arcB/arcA.

Sensor-regulator protein for anaerobic repression of the arc modulon Activates arcA via a four-step phosphorelay. ArcB can also dephosphorylate arcA by a reverse phosphorelay. ArcB can also dephosphorylate arcA by a reverse phosphorelay involving Historylate.

C. -- SUBCELLULAR LOCATION: Integral membrane protein. Inner membrane

-!- FUNCTION: Member of the two-component requiatory system arcB/arcA.
-!- FUNCTION: Member of the two-component requiatory system arcB/arcA.
Sensor-requiator protein for anaerobic repression of the arc
modulon. Activates arcA via a four-step phosphorelay. ArcB can
also dephosphorylate arcA by a reverse phosphorelay involving His-
717 and Asp-576.
-!- SUBCELLULAR LOCATION: Integral membrane protein. Inner membrane
